

INVESTOR DEMO

Café POS

A complete point-of-sale & billing platform built for cafés — real-time order flow, table management, staff approvals, payments and a live sales dashboard, all in one app.

Flutter app · Python API · AWS DynamoDB · Google Pay ready

The opportunity

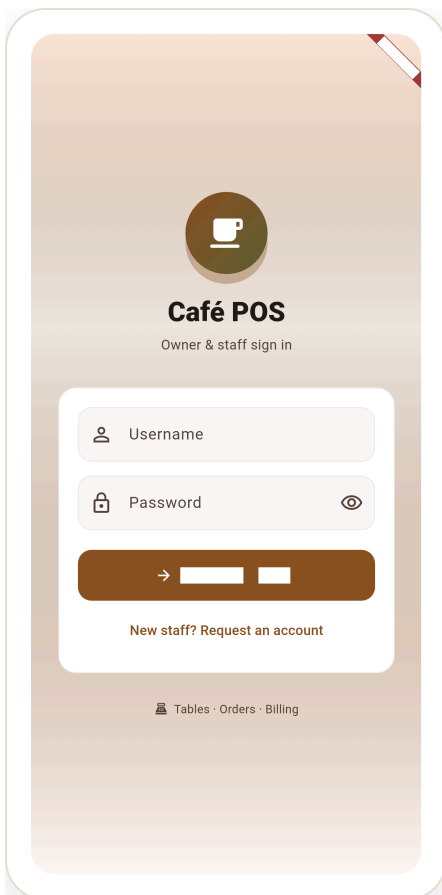

The problem

Independent cafés juggle paper orders, disconnected billing, and spreadsheets. No single source of truth for tables, orders or money means lost items and hard-to-read revenue.

The solution

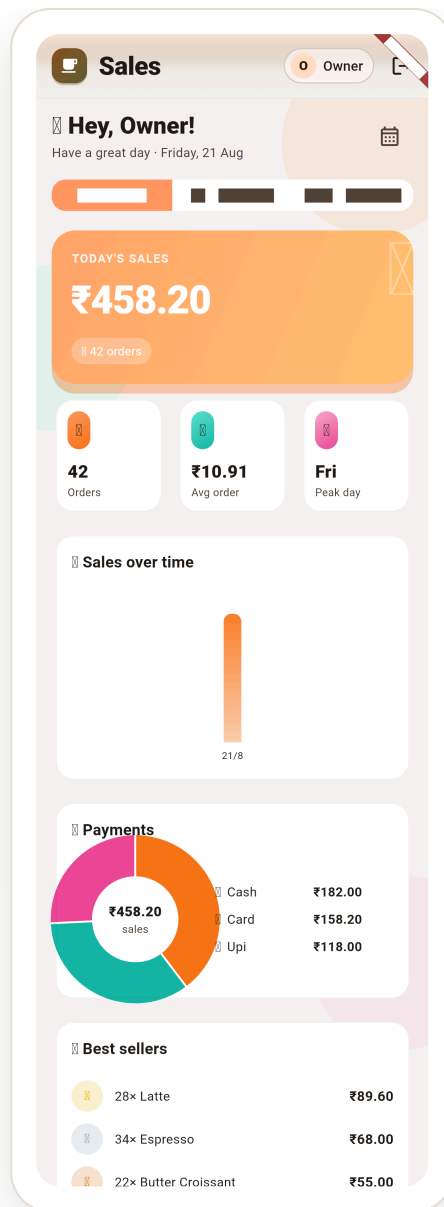

One app across owner & staff devices: orders go straight to a shared live queue, tables stay locked to the right server, and every sale is reconciled the moment it's collected.

Product at a glance

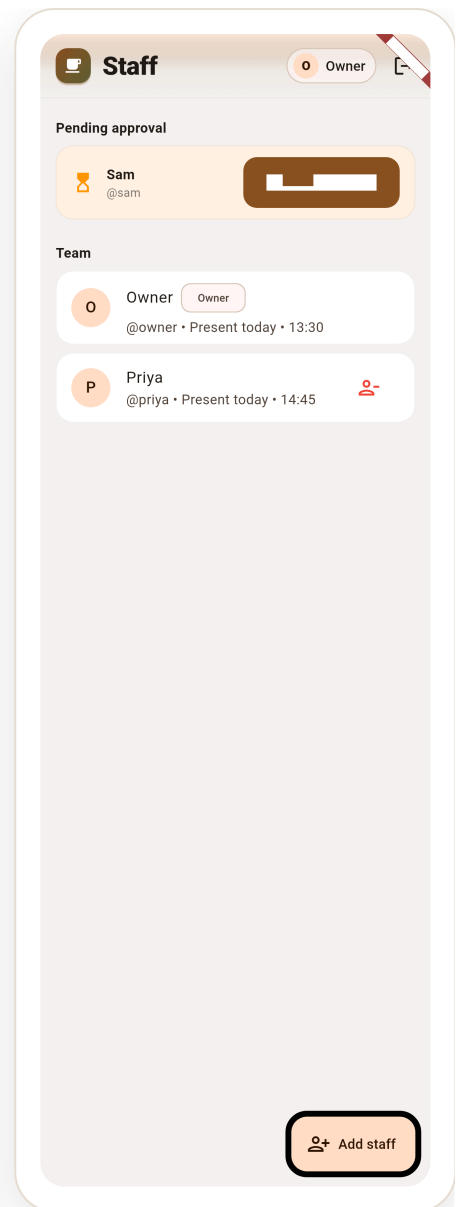

Role-based sign-in

Owner & staff accounts; new staff register and wait for owner approval.

Live sales dashboard

Today's revenue, order counts, category & payment mix, best sellers.

Staff management

Approve pending staff, manage the team, and see who's on the floor.

Capabilities

- **Live order queue** — every order appears in a shared real-time queue; staff advance status from received → preparing → ready → collected.
- **Table locking** — an order locks its table to the server who took it; other staff see it as reserved.
- **Guided billing** — cash · card · UPI · **Google Pay** (test mode today, production flags ready).
- **Reopen & add** — customers wanting more: reopen a paid order, add items, collect only the difference.
- **Owner analytics** — daily and 7/30-day reports, revenue by category & payment, best sellers.
- **Per-staff history** — every server sees their own orders, revenue and active count.
- **Menu management** — add/edit items, availability toggles and categories, priced server-side.
- **Secure by design** — JWT auth, hashed passwords, and every order total re-validated on the server.

Technology

Built to ship

Flutter (mobile + web)

Python / Flask REST API

AWS DynamoDB + S3

Google Pay (production-ready config)

JWT auth
